Abstract

This paper is developed to introduce a new method of creating ensembles of deep learning models. Many modern researches were focused on creating effective and efficient algorithms of differentiable architecture search, missing opportunity to create ensembles of less sophisticated deep learning models. This approach gives impressive results as it was shown in few modern papers. In our research we investigate an algorithm of sampling deep learning models using hypernetwork, which controls diversity of the models. Distinction between two models is measured in terms of Jensen–Shannon divergence which keeps the algorythm differentiable. To evaluate the performance of the proposed algorithm, we conducted experiments on the Fashion-MNIST and CIFAR-10 datasets and compare the resulting ensembles with ones sampled by other searching algorithms.
